FIRE CURTAIN

Alapont Global fire curtains are the most innovative system for fire and smoke protection; the next generation of fire barriers. **They offer 120-minute fire resistance. They limit the spread of fire and smoke, as well as the transmission of thermal radiation**, preventing the ignition of materials and harm to people on the unexposed side of the fire. They allow access to evacuation routes.

When no fire occurs, the curtains remain hidden, allowing for seamless integration into any environment due to their small space requirement. In the event of a fire within the room where they are installed, they automatically deploy at a controlled speed using gravity. This eliminates the risk of injury from impact.

- Control panel prepared for additional accessories.
- Available in large dimensions.
- Easy and quick installation system.
- Opening and closing around the curtain's axis.

- Minimal installation space required.
- Sectorization system on both sides.

MODELS

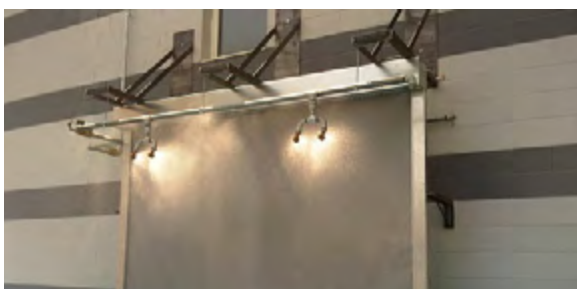

EW-90

Ensure integrity in case of fire and **prevent heat radiation** for a specified time. They also offer **smoke impermeability for 90 minutes at 1000°C**.

EI₂-120/180 - WATER-SPRAYED

Reduce heat transfer, creating a safe zone for people and property by **preventing fire spread**. This is achieved through water spraying via an **irrigation system**. Integrity, thermal insulation, and **impermeability are guaranteed for up to 180 minutes at 1000°C**.

EI₂-60/120 - NON-WATER-SPRAYED

An ideal solution **for sectoring large spaces without the need for additional walls or pillars**. They offer **high fire resistance of up to 120 minutes on both sides and wind pressure resistance up to 1300 Pa**.
